# Food Consumption and Dietary Levels of Households of Different Sizes United States -- by Region

U. S. DEPARTMENT OF AGRICULTURE

Washington, D. C.

## ACKNOWLEDGMENTS

The nationwide survey of household food consumption on which this report is based was made in April-June 1955 by the Agricultural Research Service and the Agricultural Marketing Service of the U.S. Department of Agriculture. The data were collected by National Analysts, Inc., under contract with the Department.

The survey represents the cooperative effort of many individuals in the Department. Faith Clark, Janet Murray, and Ennis C. Blake of the Consumer and Food Economics Research Division, Agricultural Research Service, had major responsibility for planning and supervision of the survey, with the assistance of George R. Rockwell, Jr.,<sup>1</sup> of the Market Development Research Division, and Thomas J. Lanahan, Jr.,<sup>1</sup>

of the Agricultural Economics Division of the Agricultural Marketing Service. Consultants for the Department in the design and analysis of the sample were Earl Houseman and Evelyn Grossman.

The survey was carried out under the general direction of Gertrude S. Weiss, Agricultural Research Service, and Robert M. Walsh and James P. Cavin, Agricultural Marketing Service.

This report on food consumption and dietary levels of households of different sizes was prepared by the Consumer and Food Economics Research Division. In addition to the staff members mentioned above, Betty Peterkin and Constance Ward assisted with this report.

# FOOD CONSUMPTION AND DIETARY LEVELS OF HOUSEHOLDS OF DIFFERENT SIZES UNITED STATES, BY REGION

That the number of persons to be fed is an important factor in the size of her food bill is a matter of common knowledge to every homemaker. That per person expenditures for food tend to decrease as family size increases has been revealed in earlier studies. The Household Food Consumption Survey, 1955, provided more detailed data on the food expenditures, quantities of foods, and adequacy of diets for families of different sizes than heretofore available. This report presents these data for households at different levels of income and for various urbanization groups and parts of the country.

The data from this survey have already been analyzed to provide summary measures of the functional relationship between household size, income, and food consumption in terms of regression coefficients and elasticities;<sup>1</sup> and to derive estimates of per person food cost differentials in large and small families attributable to economy of scale for use in estimating the cost of food in the U.S. Department of Agriculture food budgets for families of various sizes.<sup>2</sup> In addition to such summary measures however, families, home economists, welfare workers, and economists find it helpful to have available the actual patterns of food expenditures and food quantities used by households of different sizes such as those provided in this report. Comparisons of the patterns of consumption of large and small families that may be made from these data are probably as applicable in the early 1960's as in the survey period, for changes in food habits and practices of population groups occur slowly over time.

Illustrative of such comparisons are the following summary statements:

1. Large households spent more per household for food at home and used larger quantities of foods than small households at all levels of income, both in the North and in the South--in the cities and on the farms. Even so, large households spent less per person for food and with few exceptions used smaller quantities of foods per person than small households in each group studied.

2. Small households used considerably more of their food dollars for food away from home than large households--24 percent for 2-person, 16 percent for 4-person, and 12 percent for 6-or-more-person households.

3. Large households, compared with small households, generally spent more of each food dollar for milk, flour and cereals, bakery products, fats and oils, sugars and sweets, and potatoes and sweet-potatoes, and less for meat, poultry, and fish, eggs, fresh vegetables and fruits, and beverages. However, large households at high income levels and small households at lower income levels that spent like amounts per person in a week for food at home divided their food dollars among the major food categories similarly.

4. Large households, particularly those of 6 or more persons, got a greater share of their food during the week without direct expense--from home production or as gift or pay--than small households in urban, rural nonfarm, and rural farm areas. Large farm households, however, got less food per person in terms of money value from home production than small households--\$2.21 for 6-or-more-person households, \$2.86 for 4-person, and \$3.44 for 2-person households.

5. Comparisons of food patterns of large and small families show differences that are also typical of differences in the patterns of low- and high-income families. Large families as compared with small used considerably less meat, poultry, and fish, eggs, and fresh, canned, and frozen vegetables and fruits and slightly less sugars and sweets, fats and oils, bakery products, and potatoes per person. Flour and cereals and dried vegetables were used in greater quantities per person by large households. Households of 2, 3, 4, and 5 persons used milk products in similar quantities per person and households of 6 or more persons used somewhat less.

6. Large households which on the average spent less per person for food, were less likely to have adequate diets than small households. Thirty-four percent of the 6-or-more-person households, 45 percent of the 5-person households, and 55 to 60 percent of 2-, 3-, and 4-person households had diets that met the National Research Council's recommended dietary allowances for all of the eight nutrients calculated.

7. Large households with high incomes fared somewhat better nutritionally than small households with low incomes that spent about the same per person for food. Fifty-four percent of the 5-person households at the \$4,000-\$5,999 income level, 50 percent of the 4-person households at the \$2,000-\$3,999 income level, and 43 percent of the 2-person households at the under-\$2,000 income level had diets meeting allowances for all eight nutrients. Each of these groups spent about \$7 per person per week on the average for food.

## Money value of food<sup>3</sup> used at home

The consistency of trends in money value of food for households of different sizes on a per household basis and on a per person basis is illustrated in the following averages for the United States as a whole and for urban, rural nonfarm, and rural farm areas:

	Money value of food used at home in a week by households of--				
	2 persons	3 persons	4 persons	5 persons	6 or more persons
<u>Per household</u>					
United States.....	\$18.00	\$25.09	\$29.94	\$34.06	\$37.32
Urban.....	18.61	25.97	30.77	35.67	39.84
Rural nonfarm ....	16.41	23.38	28.38	31.64	33.89
Rural farm .....	17.98	23.99	28.79	32.42	37.08
<u>Per person</u>					
United States .....	\$9.57	\$8.56	\$7.68	\$6.95	\$5.52
Urban.....	10.06	8.86	7.91	7.29	6.08
Rural nonfarm ....	8.59	7.98	7.26	6.43	5.01
Rural farm .....	8.99	8.13	7.31	6.55	5.11

NOTE: 21 meals at home = 1 person. See Glossary, Household size.

In each urbanization group households of 6 or more persons spent only a little more than twice as much for food at home as 2-person households. Consequently the expenditure per person was much larger for the small household than for the large one. A combination of several factors which affect food needs and use in the household may account for these differences.

Large households, with a greater proportion of young children, would need less per person of most foods and could meet their needs with less expenditure per person than small households. As shown in table 2, 96 percent of the 6-or-more-person, 83 percent of the 4-person, and 9 percent of the 2-person households studied had children under 16 years of age.

Large households can more often take advantage of large-quantity buying at lower unit price, and generally are believed to discard less food as waste than small households. Thus it has been estimated that a 4-person family has a 5-percent cost advantage over a 3-person family, and a 10-percent advantage over a 2-person family. On the other hand, savings arising from such "economies of scale" permit the 5- and 6-person families to achieve the same food consumption level as the 4-person family at 5 and 10 percent less cost per person, respectively.<sup>4</sup>

<sup>3</sup> As used in this report, money value of food used includes cost of purchased foods and beverages, including alcoholic beverages, value of foods received as gift or pay, and value of foods produced at home.

<sup>4</sup> The procedures used in arriving at these estimates are given in detail in appendix B of Family Food Plans and Costs. U.S. Dept. Agr. Home Econ. Res. Rpt. 20, November 1962

But perhaps the most influential factor is that of difference in average per capita income of large and small households. The large household is generally not financially able to furnish each person in the family with as much food and as expensive food as the small household.

The increase in money value of food per household as household size increased was greater at high than at low income levels (chart 1). This would be expected since the small households can better afford greater expenditures for food than the large households at the lower levels of income. Chart 2 shows the similar declines in money value of food per person for households at different levels of income as the number of persons in the households increased.

The value of food used by rural farm households was considerably less influenced by income than was the value of that used by urban and rural nonfarm households--owing in part to the greater use of home-produced foods by low-income farm families.

Large urban families on the average spent more of their income dollars for purchased food used at home than small families, whereas, small families spent proportionately more for food away from home. Therefore, the amount per \$100 of income going to the purchase of

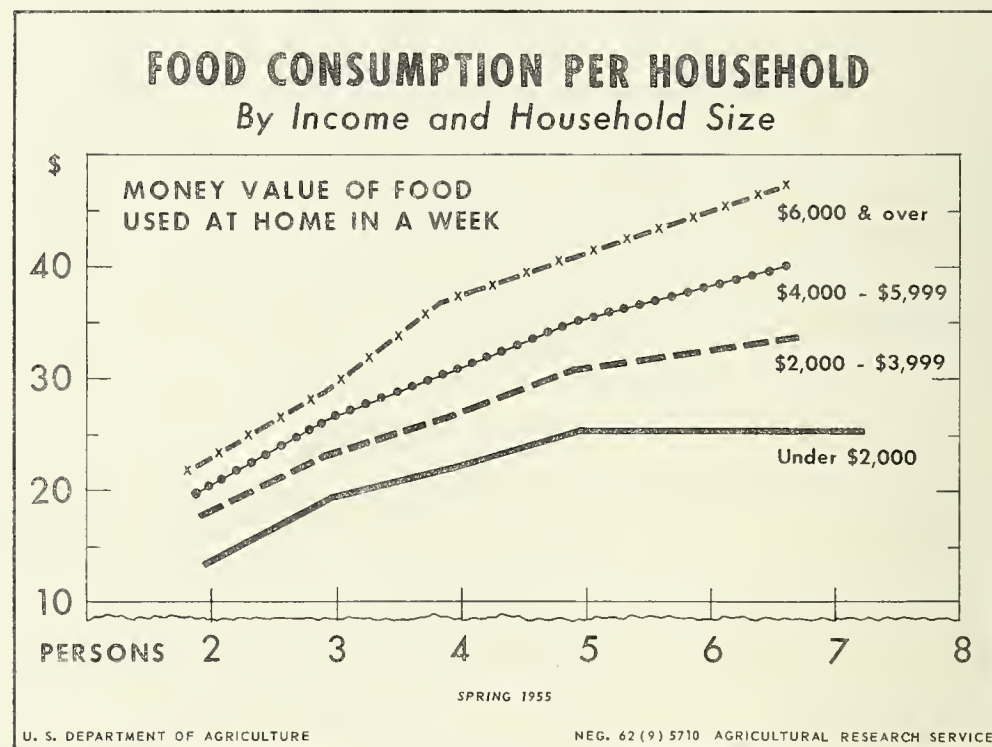

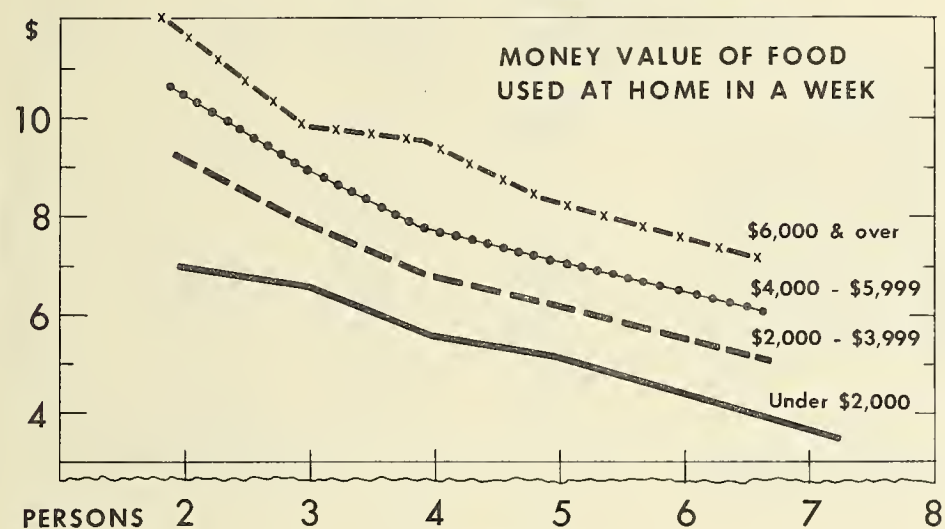

CHART 1

## FOOD CONSUMPTION PER PERSON By Income and Household Size

U. S. DEPARTMENT OF AGRICULTURE

NEG. 62 (9) 5711 AGRICULTURAL RESEARCH SERVICE

CHART 2

all food showed a smaller relative increase with increase in household size, as shown by the following figures for urban households of different sizes:

### Expenditures for food per \$100 income

	At home	At home and away
2 persons.....	\$20	\$27
3 persons.....	26	32
4 persons.....	28	34
5 persons.....	32	38
6 or more persons.....	34	39

### Cost of food away from home

Food away from home took a greater part of the food money of small than of large households in the North and the South at all levels of income. Small households in cities used considerably more of their food dollars for food away from home than large households--26 percent for 2-person, 17 percent for 4-person, and 12 percent for

6-or-more-person households. In contrast, rural farm families in the various size categories all used about the same proportion of their food dollar--around 12 percent--for food away.

Fewer 2-person households and households of 6 or more persons than households of 3, 4, and 5 persons ate meals away from home during the week studied. Two-person households that had meals away spent much more for them than larger households, even though larger households had the possibility of more persons eating away.

The level of family income was the main factor influencing eating away from home for households of all sizes. Most influenced were 2-person households. Five times as many of the 2-person households with incomes of \$6,000 and over as of those with incomes under \$2,000 ate meals away during the week studied. The much greater proportion of older couples in the low-income group probably contributed to these differences.

Fewer 2-person households bought food and beverages to supplement meals carried from home and for between-meal refreshments away from home than larger households with proportionately more children. The amount spent by the large households having food other than meals away was usually more than for the small.

The percentage of households at different income levels having food away from home during the survey week and the expense per household are as follows:

	Percentage of families having--		Expense per family having--	
	Meals away	Other food away	Meals away	Other food away
All incomes:				
2 persons.....	49	52	\$8.62	\$1.77
4 persons.....	56	70	6.48	2.30
6 or more persons.....	44	66	5.70	2.59
Under \$2,000: <sup>1</sup>				
2 persons.....	15	33	5.47	.88
4 persons.....	35	52	3.48	1.21

6 or more persons.....	61	72	7.55	3.67

<sup>1</sup> Money income after taxes.

### How the food dollar was spent

The money value per person for each of the major food categories except flour and cereals declined as the number of persons in the

household increased. There were, however, differences among the food categories in the degree of decline which can be conveniently illustrated by showing the way in which households of different sizes chose to distribute their food dollars among the major food categories, as follows:

Distribution of food dollar

by households of--

	<u>2</u> <u>persons</u>	<u>3</u> <u>persons</u>	<u>4</u> <u>persons</u>	<u>5</u> <u>persons</u>	<u>6 or</u> <u>more</u> <u>persons</u>
Milk products.....	\$0.132	\$0.143	\$0.154	\$0.160	\$0.168
Fats and oils .....	.043	.041	.042	.043	.047
Flour, cereals, and bakery products....	.089	.096	.103	.108	.121
Meat, poultry, and fish, eggs.....	.375	.367	.357	.351	.333
Sugars, sweets .....	.029	.030	.031	.034	.038
Potatoes, sweet- potatoes.....	.018	.021	.021	.022	.025
Fresh vegetables and fruits .....	.118	.108	.102	.099	.101
Processed vege- tables and fruits and juices.....	.061	.061	.061	.061	.058
Beverages.....	.099	.091	.085	.076	.064
Miscellaneous foods..	.036	.042	.044	.046	.045
	<u>\$1.000</u>	<u>\$1.000</u>	<u>\$1.000</u>	<u>\$1.000</u>	<u>\$1.000</u>

Large households, with proportionately more children than small households, spent more of each food dollar for milk products. They gave more of their food dollar for food categories that are relatively less expensive sources of food energy--flour and cereals, fats and oils, sugars and sweets, and potatoes and sweetpotatoes--and less for meat, poultry, and fish, beverages, and fresh vegetables and fruits. These differences are to a great extent a result of the lower per capita income of large households.

On the other hand, large households and small households that spent like amounts per person for food in a week used similar parts of their food dollar for the major food groups. Spending patterns for four groups of households of different sizes and income levels that used food with an average money value of about \$7 for the week are shown by the following data:

Distribution of food dollar

by households of--

	<u>2 persons</u> <u>(Under</u> <u>\$2,000)</u>	<u>4 persons</u> <u>(\$2,000-</u> <u>\$3,999)</u>	<u>5 persons</u> <u>(\$4,000-</u> <u>\$5,999)</u>	<u>6 or more</u> <u>persons</u> <u>(\$6,000</u> <u>and over)</u>
Milk products.....	\$0.153	\$0.156	\$0.162	\$0.159
Fats and oils .....	.054	.043	.041	.043
Flour, cereals, and bakery products ....	.110	.109	.110	.112
Meat, poultry, and fish, eggs.....	.346	.352	.350	.344
Sugars, sweets .....	.036	.034	.034	.036
Vegetables and fruits..	.197	.184	.179	.189
Beverages.....	.072	.075	.075	.072
Miscellaneous foods...	.032	.047	.049	.045
	<u>\$1.000</u>	<u>\$1.000</u>	<u>\$1.000</u>	<u>\$1.000</u>
Average money value of food per person in a week.....	\$6.99	\$6.81	\$7.19	\$7.15

Households of each size in the South spent a cent or two more of each dollar for flour and cereals, fats and oils, sugars and sweets, and less for meats and beverages than households of similar size in the North. Household size affected spending among food categories in about the same way in the North and South with one exception: bakery products took a greater share of the food dollar as household size increased in the North but not in the South.

Money value of food was distributed among the food categories differently for farm and urban households, but in general the differences were consistent from one household size group to another. Milk was an exception. Two- and three-person urban households spent less of their food dollars for milk products than larger urban households, whereas 2- and 3-person households on the farm gave milk about the same importance as larger families.

The effect of household size on the way the food dollar was spent was similar at all income levels except the under-\$2,000 level. At this level households of 6 or more persons spent proportionately more for fats and oils and flour and cereals and less for bakery products than large families at other income levels. Two-person households spent proportionately more for bakery products and milk products than 2-person households with higher incomes.

Large families on the average chose less expensive items or less expensive grades within all food categories. The following figures show the average price per pound paid for foods in the major categories:

	<u>Average price per pound paid</u>		
	<u>by households of--</u>		
	<u>2 persons</u>	<u>4 persons</u>	<u>6 or more persons</u>
Milk, cream, ice cream, and cheese <sup>1</sup> .....	\$0.27	\$0.26	\$0.23

<sup>1</sup> Price per quart of milk equivalent.

#### Money value of food without direct expense

For the United States as a whole, the value of food produced at home or received as gift or pay represented almost \$10 of every \$100 worth of food used at home. The amount varied from \$3 for urban to \$43 for farm families.

Households of 6 or more persons, whether they lived in urban, rural nonfarm, or rural farm areas, obtained a greater part of their food without direct expense, as the following figures show:

	<u>Food without direct expense per</u>			
	<u>\$100 money value of all food</u>			
	<u>All urban- izations</u>	<u>Urban</u>	<u>Rural nonfarm</u>	<u>Rural farm</u>
2 persons.....	\$8.44	\$3.06	\$12.07	\$41.66
4 persons.....	9.22	2.99	12.16	42.24
6 or more persons .....	15.25	3.59	13.99	45.98

The per capita money value of food produced at home was considerably more for the small farm household than for the large. However, the share of total food coming from home production for the United States as a whole was less for small households than for large households, mainly through the influence of northern households. In the South small households tended to include home-produced foods in the same proportion as large households. The value of food produced at home per person and the amount coming from home production per \$100 total money value of all food by the size of rural farm households in the North and the South are shown below:

	<u>Money value of home-produced food per person</u>		<u>Home-produced food per \$100 money value of all food</u>	
	<u>North</u>	<u>South</u>	<u>North</u>	<u>South</u>
2 persons.....	\$3.28	\$3.66	\$35	\$42
3 persons.....	3.25	3.22	38	42
4 persons.....	2.99	2.68	38	40
5 persons.....	2.81	2.54	39	46
6 or more persons.....	2.73	1.74	43	43

Small farm households at all levels of income with one exception--the \$6,000-and-over level in the North--tended to produce more at home per person in terms of money value than large farm households. The difference was most marked at low levels of income--at the under-\$2,000 level households of 2 persons got \$3.44 worth of food from home production per person in a week whereas households of 6 or more persons got only \$1.63 worth.

In terms of quantity, the home-produced share of the milk products used was generally greater in the southern than in the northern farm households. In the South the proportion of milk from home production remained fairly constant regardless of household size. In the North it increased with the number of persons in the household. In general, households of 6 or more persons made greater use of home-produced potatoes and other vegetables than smaller households in both the North and the South, but large southern farm households, which included a large proportion of low-income households, did not get nearly as much of their meat, poultry, and fish, eggs, and fats and oils from home production as small households.

The percentages of total quantities of the major food groups used in a week that came from home production by rural farm households of different sizes in the North and the South are as follows:

Percentage from home production  
in households of--

	<u>2</u> <u>persons</u>	<u>3</u> <u>persons</u>	<u>4</u> <u>persons</u>	<u>5</u> <u>persons</u>	<u>6 or</u> <u>more</u> <u>persons</u>

<sup>1</sup> Includes fresh produce that was canned or frozen at home.

Consumption of specific foods

Although there were no marked differences in the use of fresh fluid milk per person by households of different sizes for the United States as a whole, there were very different consumption patterns for households of the same size in farm and urban households in the North and South. These wide variations are shown in the following figures:

Quarts of fluid milk used per person  
in a week by households of--

	<u>2</u> <u>persons</u>	<u>3</u> <u>persons</u>	<u>4</u> <u>persons</u>	<u>5</u> <u>persons</u>	<u>6 or</u> <u>more</u> <u>persons</u>
United States.....	3.4	3.5	3.5	3.4	3.0
Urban.....	3.2	3.3	3.5	3.3	3.0
Rural farm .....	5.2	4.7	4.3	4.2	3.7
North .....	3.4	3.7	3.7	3.7	3.4
Urban.....	3.3	3.6	3.7	3.6	3.3
Rural farm .....	4.8	4.4	4.3	4.4	4.4
South .....	3.3	3.1	3.0	2.6	2.3
Urban.....	2.7	2.6	2.6	2.4	2.0
Rural farm .....	5.9	5.1	4.2	3.9	3.1

Farm households of 2 persons used large quantities of fresh fluid milk--enough for 3 cups per person per day in the North and 3-1/2 cups in the South. In the North consumption was constant for farm households of more than 2 persons, but in the South quantities per person fell off sharply as household size increased.

Urban households of 3, 4, and 5 persons in the North used more fluid milk per person than 2-person households even though they spent less per person for food. Households of 6 or more persons, spending even less per person for food, used as much fluid milk as 2-person households. Urban households in the South used less than any other group. Large households fared particularly poorly, using only about 1 cup per person per day.

Processed milk was used in somewhat greater quantities per person by large than by small nonfarm households. Cream consumption fell off steadily as household size increased. Two- and three-person households used more ice cream per person than larger households with proportionately more children. However, a greater percentage of large households than of small ones used ice cream at home during the week studied. Cheese was heavily used by 2-person households and declined in use as the number of persons in the household increased.

Meat, poultry, and fish consumed per person dropped off markedly in terms of both quantity and money value as the family size increased--in rural and urban areas--in the South and the North--and at low and high income levels. Large households, which included proportionately more farm households and southern households than did small households, probably used less expensive cuts and grades of meats than small households as indicated by the lower average price paid per pound. Luncheon meats and pork tended to play a more important part and beef and poultry a less important part in diets of these large families.

Eggs also were used in smaller quantities by large households. On the average, households of 6 or more persons ate only about two-thirds as many eggs per person as 2-person households.

The flour and cereals group was the only major category showing any increase in per capita consumption with increased household size, and consumption of these foods was markedly higher only for the largest families. Households of 6 or more persons used 36 percent more flour and cereals per person on the average than 4-person households. The greater use of flour and cereals by large households was most pronounced for rural families in the South. At low income levels, large households--most of them from the South--probably used their greater quantities of flour for making bread as well as other baked goods, as indicated by much smaller quantities of purchased bread.

The use of sugars and sweets remained fairly constant for all household sizes in the various population groups. More large households than small households used candies and jams and jellies during the week studied, but they used less of them. Thus, the average quantities consumed per person were similar for all household size groups.

Two-person households were the greatest users of fats and oils--using 1 pound per person in a week compared with 0.9 pound for 4-person and 0.8 pound for 6-or-more-person households. This difference was almost entirely a result of heavier use of butter by smaller households, particularly 2-person households.

Fresh, frozen, and canned fruits and vegetables and dried fruits were used in larger quantities per person by small than large households, potatoes and sweetpotatoes were used in similar quantities by households of all sizes, and dried vegetables were used in larger quantities by large households. To better see the effect of the size of the household on the use of the vegetables and fruits groups, quantities used per person in a week for each of the household size groups have been related to the quantities used by 2-person households as follows:

	<u>Relative quantities used</u>		
	<u>per person in a week</u>		
	<u>by households of--</u>		
	<u>2</u>	<u>4</u>	<u>6 or</u>
	<u>persons</u>	<u>persons</u>	<u>more</u>
			<u>persons</u>

Commercially canned fruits.....	100	87	55
Dry beans and peas.....	100	91	173
Dried fruits.....	100	56	44
Juices.....	100	82	51

Fewer 2-person households than households with proportionately more children used nuts, peanut butter, soups, catsup, pickles and olives, puddings and pie fillings, chocolate and chocolate sirup, and soft drinks and fruit ades during the week studied. Except for nuts and peanut butter and catsup, however, 2-person households using these items used them in sufficient quantities to make the amounts per person on the average as high for the 2-person group as for larger households.

The amount spent for coffee, tea, and alcoholic beverages per person fell off sharply with increased household size, as would be expected for foods used predominately by adults.

#### Dietary adequacy

More small than large households had diets that furnished recommended amounts of eight nutrients as specified by the National Research Council. (See Glossary, Recommended dietary allowances.) Calcium and riboflavin, coming mainly from milk products, and ascorbic acid and vitamin A value, with best sources in the vegetables and fruits group, were most often in short supply. Almost one out of every four 2-person households and two out of every four households of 6 or more persons had diets failing to meet the recommended

amounts for calcium. Foods in one out of every five 2-person households and two out of every five households of 6 or more persons failed to furnish the amount of ascorbic acid recommended.

Diets of 3- and 4-person households furnished the recommended amounts of each of the eight nutrients as frequently or almost as frequently as diets of 2-person households. Five-person households were less likely to have adequate diets than smaller households, but considerably more likely to eat well than households of 6 or more persons.

Following are the percentages of households of different sizes using food at home in a week that furnished less than the recommended amounts of nutrients, and the money value per person of the food:

	<u>Percentage of households with diets</u>				
	<u>furnishing less than recommended</u>				
	<u>allowances, households of--</u>				
	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>	<u>6 or</u>

<sup>1</sup> Cooking losses deducted.

Large households with high incomes, however, were more likely to have diets meeting allowances for the eight nutrients than small low-income households that used foods of similar money value per person. Recommended amounts for all nutrients except calcium are considerably less for children under 10 years of age than for adults. Therefore, with present food habits the food dollar of the large household with proportionately more young children could buy a more adequate diet than the food dollar of the household with more adults. Also, the economies in buying and serving larger numbers of people already mentioned make possible better diets for large than small families for the same money spent. The percentage of households with diets furnishing less than recommended amounts of any one or more of the nutrients and each of the nutrients separately for four groups of households of different sizes and levels of income using foods valued at about \$7 per person in a week are as follows:

Percentage of households with diets  
furnishing less than recommended  
allowances, households of--

	<u>2</u> <u>persons</u> (Under \$2,000)	<u>4</u> <u>persons</u> (\$2,000- \$3,999)	<u>5</u> <u>persons</u> (\$4,000- \$5,999)	<u>6 or</u> <u>more</u> <u>persons</u> (\$6,000 and over)

<sup>1</sup> Cooking losses deducted.

But most large households are not in a position to spend as much per person for food as small households. The relatively poor nutritional position, on the average, of large households as compared with small households was found in the North and South, both in rural and in urban areas. Diet adequacy fell off more sharply with increase in household size in the South than in the North and in the farm areas of the South than in urban areas, as shown by the following data for households whose diets failed to provide recommended amounts of any one or more of the eight nutrients:

Percentage of households with diets  
furnishing less than recommended  
allowances, households of--

	<u>2</u> <u>persons</u>	<u>3</u> <u>persons</u>	<u>4</u> <u>persons</u>	<u>5</u> <u>persons</u>	<u>6 or</u> <u>more</u> <u>persons</u>

Rural farm.....	41	45	59	74	81

At each income level small households had better diets than large households. (See chart 3.) At the under-\$2,000 level 57 percent of the 2-person households compared with 86 percent of the 6-or-more-person households had diets which failed to meet allowances for at least one of the eight nutrients. Even at the \$6,000-and-over income level, small households more often met these standards of good nutrition than large households, but the differences were not so consistent from one household size group to another as at lower levels of income.

Diets of small households which did not meet allowances generally were short in only one or possibly two of the eight nutrients, whereas diets of large households were often short in several of the eight nutrients.

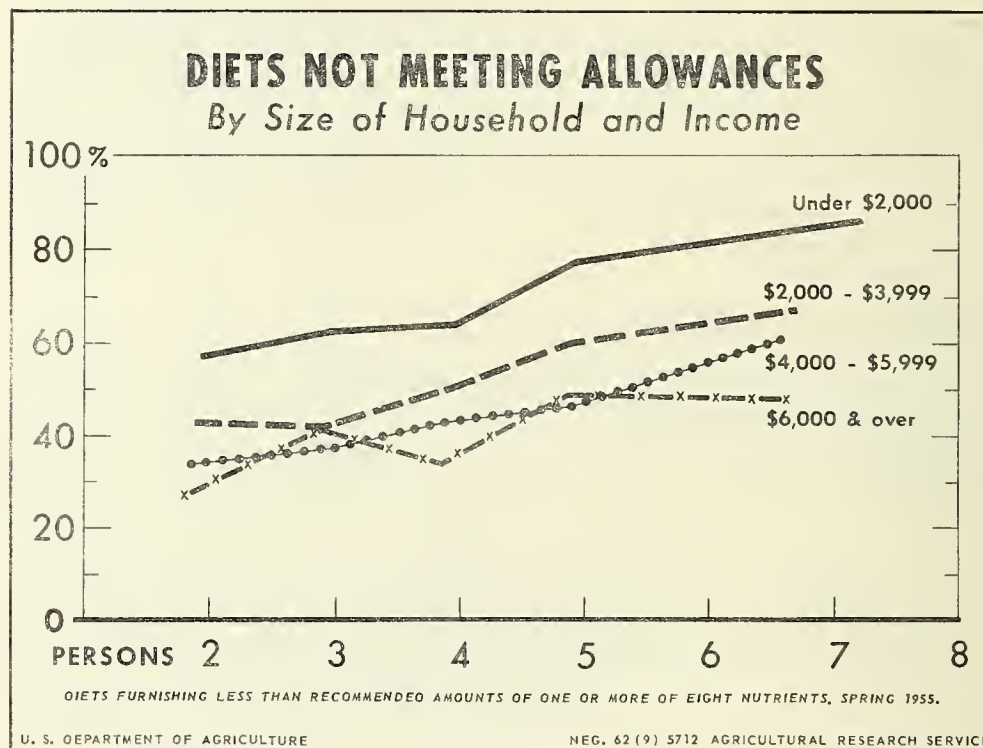

CHART 3

## DESCRIPTION OF SURVEY

This report contains a portion of the data from the U.S. Department of Agriculture's nationwide Survey of Household Food Consumption made in the spring of 1955. The survey was part of the Department's broad program of research on family dietary levels and the marketing and utilization of farm products.

Periodic examinations of food consumption of population groups are needed for many purposes--for administration of public programs affecting food supply, distribution, and consumption; for educational programs to improve food habits; and for private efforts to broaden and improve the marketing of foods. Nationwide surveys of food consumption were made in 1936 and 1942, and a survey of food consumption of urban families in 1948. No surveys of rural families have been made since 1942 except on a regional basis.<sup>1</sup>

The 1955 survey is the most comprehensive yet undertaken. Its objectives, like those of the earlier surveys, were to obtain information on patterns of household food consumption and expenditures, dietary levels, and food practices. In this report the households are grouped (1) by regions--North (Census of Population regions Northeast, North Central, and West combined) and South; (2) by urbanization--rural farm, rural nonfarm, and urban--within regions; (3) by several family income classes within region-urbanization categories; and (4) by five household size classes within region-urbanization income categories.

The survey was based on a national probability sample of approximately 6,000 housekeeping households of one or more persons. Housekeeping households were defined as those in which at least one member had 10 or more meals from home food supplies during the week preceding the interview.<sup>2</sup> Institutions and persons living on military reservations were not represented. To assure adequate farm coverage, the sample included in addition to a basic cross section of about 4,500 urban, rural nonfarm, and rural farm households, a supplemental sample of about 1,500 farm-operator households. Hence it was

necessary in combining the data for rural farm and the other urbanizations, to use appropriate weights in order to obtain the "all-urbanizations" averages. A more detailed description of the sample design and its appraisal is given in Reports 1 to 5 of this series.

Collection of the data, made during April, May, and June of 1955, was by personal interview with a household member, usually the homemaker. Information was obtained on quantities of food consumed or used up in the household during the 7 days preceding the interview and expenditures for the purchased items, on the number of meals eaten at home by each household member, expenditures for food eaten away from home, and the number of meals purchased away from home or received as gift or pay, and on selected family characteristics, including income, age, employment status, and education of the homemaker, and household food practices, such as home baking, canning and freezing, and production of food.

In requesting the information from households, trained interviewers used a schedule including a detailed food list to help respondents recall the quantities of foods used during the week and the amounts paid for purchased items. (This method is sometimes referred to as the "recall-list method.") Since the success of surveys of this type depends in large part on the interviewer's skill in drawing out the necessary information from the person interviewed, considerable care was taken in the selection and training of the interviewers. At training schools lasting from 3 to 5 days, instructions and practice in the sampling phase of the survey, in interviewing, and in recording in correct form on the schedule were given to each interviewer. In addition, to insure that all interviews would be conducted in an identical and systematic fashion, each interviewer was furnished a manual of instructions covering each phase of the survey for use during training school and for reference during the collection period.

A glossary beginning on page 165 explains the major terms used in this study.

## NOTES ON USE OF TABLES

The tables that follow, except table 3, give data for households. For analyses on a per person basis, averages per household may be divided by the number of persons per household shown in table 2.

Each table includes data for each region, each urbanization (except tables 19 and 20), each income class, and size of household.

Where combinations for groups of households are needed, they may be computed by using the counts shown in table 1. In making combinations, the appropriate adjustments for the oversampling of the rural farm households must be made. For example, in combining income classes for "all urbanizations," the columns showing the weighted

counts, where this adjustment has already been made, should be used. In combining rural farm and rural nonfarm into a single rural group, the full count of rural nonfarm, but only one-fourth of the rural farm households shown in table 1, should be used.

Table 1 presents the counts of survey households in each of the region, urbanization, income, and size-of-household classification groups for which percentages or averages are shown in this report. Households covered are those of two or more persons. Although this report does not show separate data for households not classified by income, counts of these households are presented in table 1 to show what is included in "All incomes" classes.

The number of households in some of the cells is small but data are shown for each to permit maximum flexibility in analyses.

<sup>1</sup> See p. 168 for list of earlier surveys.

<sup>2</sup> Data included in this report are for households of 2 or more persons.

Table 2 shows the average household size in equivalent persons (21 meals at home equal 1 person), the percentage of households that included children under 16 years of age, and with homemakers 60 years of age or older, and the money value of and expenditures for foods and beverages used at home in a week. For rural farm households the money value of home-produced foods used at home in a week is also shown.

Household averages have been divided by average household size to get averages per person in this table (and in the analyses presented earlier, pp. 1-8). The use of the number of 21-meal-at-home equivalent persons for computing averages per person is an attempt to adjust for the fact that the number of persons in the family is not always identical with the number of persons eating from household (home) food supplies. Some members may have eaten meals away from home, and nonfamily members (guests, hired help, boarders) may have eaten from the respondent's household food supplies. This method has the limitation of assigning equal weight in quantity and cost of all meals (morning, noon, and evening) and makes no allowance for any difference between amounts or kinds of food at meals eaten away and those served at home.

Because of rounding, the total money value of all food used in a week, shown in table 2, may not equal the sum of averages for food groups shown in tables that follow, nor in turn will the sum of averages of food items comprising a food group always equal the group average. Similarly, average quantities for food groups and subgroups may not equal the sum of averages for corresponding items, partly because of rounding and also because some quantities have been converted to equivalent. Also a few inconsistencies, affecting both quantities and money value, occurred in tabulating, but differences resulting therefrom are usually small, rarely more than 1 or 2 percent.

Table 3 presents family expenditures for purchased meals, supplements to meals, snacks, and beverages consumed away from home by family members, guests, and household help, and the percentage of families having such expenditures in a week. Tips and sales taxes are included. Similar information was not obtained for household members that did not pool income with the primary economic family, such as boarders, farm help, and members of secondary economic families. Data on family size are not available, and the average household size in 21-meal equivalent persons is not, strictly speaking, applicable as a divisor for computing averages per person.

Tables 4, 5, and 6 present, respectively, the percentage of households using, the quantity, and the money value of major groups of foods used at home in a week per household. Foods are grouped according to the form in which they appear in the retail market (see Glossary, Food used at home). Data in these tables pertain to foods from all

sources combined, that is, purchased, home-produced, or received as gift or pay. For the most part food was reported in the form in which it was brought into the household, whether purchased, produced at home, or received free; foods included in homemade mixtures used during the week were usually reported as the respective ingredients, with the source of each specified. In these tables all bakery products and frozen and canned vegetables and fruits are commercial products.

Tables 7 through 18 include percentages and averages for subgroups of foods included in the major food groups shown in tables 4 through 6, and pertain to food from all sources, usually as brought into the home. However, some homemade foods were reported in the form used rather than as brought into the kitchen. Among these exceptions are home-made butter, cream, and cottage cheese, reported as such rather than as milk, because of the difficulty of correcting quantities for unused byproducts. Homemade jellies, jams, and preserves, home-dried vegetables and fruits, home-canned soups, and homemade pickles and relish-type foods were also reported and tabulated in their processed state (see Glossary, Food used at home).

Tables 19 and 20 are limited to selected foods produced at home by rural farm households (see Glossary, Food home-produced). Percentages of households using and quantities per household are shown.

Tables 21 through 26 present some of the same basic data as tables 4 through 18, but here the foods are grouped to take account of their nutritional rather than their marketing characteristics (see Glossary, Nutrition groupings of food). Only selected nutrition groupings of food are included. For data on foods omitted here, the reader is directed to earlier tables.

Averages in tables 4 to 26 are based on all households in the cell (table 1) whether or not they used the specified food. Since the percentage of households using the food is shown, averages for these households only can be obtained by dividing the average for all households in the cell by the percentage using.

Table 27 shows the percentage of households using food at home that did not furnish specified amounts of 8 nutrients. Two levels are shown, the higher representing recommended amounts per nutrition unit per day, based on the recommended dietary allowances of the National Research Council (see Glossary, Recommended dietary allowances). For this table the nutrient content of food used in each household was calculated separately (see Glossary, Nutritive value of diets).

Table 28 shows the percentage of households using food at home that furnished specified quantities of food energy per nutrition unit per day and furnished specified amounts of fat per 100 calories.

<sup>1/</sup> 21 meals at home = 1 person. See Glossary, Household size. <sup>2/</sup> The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without the extra schedules. The effective sample size (i.e., the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items. <sup>3/</sup> Includes a few urban farm households. <sup>4/</sup> Includes families unwilling or unable to report their income; includes also a few households with no economic family during the week preceding the interview and/or in 1954.

NOTE: Component items may not add to totals because of rounding.

Table 2.--HOUSEHOLD SIZE AND MONEY VALUE OF FOOD

UNITED STATES  
BY URBANIZATION

Average household size, percentage of households with children and with homemakers 60 years of age or older, and average money value of food used at home in a week by source, April-June 1955 (based on all households in cell, table 1); housekeeping households of 2 or more persons, by urbanization, income, and household size

Money income after income taxes (dollars), and household size <sup>1/</sup>	Average household size <sup>1/</sup>	Households with--		Money value of food used at home <sup>3/</sup>				Average household size <sup>1/</sup>	Households with--		Money value of food used at home <sup>3/</sup>					
		Children under 16 years (3)	Home-makers 60 years or over <sup>2/</sup> (4)	Per household		Per person <sup>4/</sup>			Children under 16 years (10)	Home-makers 60 years or over <sup>2/</sup> (11)	Per household			Per person <sup>4/</sup>

1/ 21 meals at home = 1 person. See Glossary, Household size. 2/ Based on total number of households in cell with homemaker reporting age. 3/ Includes alcoholic beverages. 4/ Household averages divided by average household size. 5/ Valued at prices reported by families in the same region and urbanization group purchasing a similar item. 6/ Includes households not classified by income.

Table 3.--FAMILY EXPENSE FOR FOOD AWAY FROM HOME

NORTH  
BY URBANIZATION

Average expenditure per family and percentage of families having expense for meals and other food eaten away from home in a week, April-June 1955; housekeeping households of 2 or more persons, by urbanization, income, and household size

Money income after income taxes (dollars) and household size  (1)	Expense for food away from home 1/			Families having expense for food away from home 1/			Expense for food away from home 1/			Families having expense for food away from home 1/

1/ 21 meals at home = 1 person. 2/ Includes households not classified by income.

## DATA FOR THE SOUTH

Table 2.--HOUSEHOLD SIZE AND MONEY VALUE OF FOOD

SOUTH  
BY URBANIZATION

Average household size, percentage of households with children and with homemakers 60 years of age or older, and average money value of food used at home in a week by source, April-June 1955 (based on all households in cell, table 1); housekeeping households of 2 or more persons, by urbanization, income, and household size

Money income after income taxes (dollars), and household size 1/	Average house- hold size 1/	Households with--		Money value of food used at home 2/				Average house- hold size 1/	Households with--		Money value of food used at home 3/					
		Children under 16 years	Home- makers 60 years or over 2/	Per household		Per person 4/			Children under 16 years	Home- makers 60 years or over 2/	Per household			Per person 4/

1/ 21 meals at home = 1 person. 2/ Includes households not classified by income.

## GLOSSARY

### COOKING LOSSES

See "Nutritive value of diets."

### DIETARY ADEQUACY

Refers to nutritive value of foods used at home per equivalent nutrition unit in relation to recommended dietary allowances. (See "Nutritive value of diets," "Recommended dietary allowances," and "Notes" on use of tables 27 and 28.)

### EQUIVALENT NUTRITION UNIT

The equivalent of an adult male in terms of allowances for a specified nutrient. The number of nutrition units in a household for a given nutrient tells how many times the amount recommended for an adult male 25 years of age is needed by that household to meet recommended allowances for the nutrient. (See "Recommended dietary allowances.")

### FAMILY, ECONOMIC

Defined for purposes of this study as a person living alone or a group of persons who lived together and drew from a common fund for their major items of expense. All unmarried sons and daughters who lived at home were considered part of the economic family. Other persons, related or unrelated, who lived with the family were considered members of the economic family if they drew from the common family fund for food, housing, and automobile expense and, in addition, for at least one other category of major expense such as clothing or medical care, or if they pooled their savings with those of the family. Family members temporarily away from home--at school, at work, or on vacation--were considered members of the economic family, although not residing in the dwelling unit at the time of the interview.

### FAMILY, ECONOMIC, PRIMARY

There may have been more than one economic family in a household unit. If so, the one that was more closely connected with maintaining the dwelling unit was the "primary" one.

### FAMILY, ECONOMIC, SECONDARY -

If two or more economic families were present in a household, members of the one not considered primary (see above) were considered in the same way as boarders and hired help, i.e., they were counted in terms of 21-meal equivalents in computing household size, but information on their expenses for food away from home and their income was not requested.

### FARM

Defined as in the United States Census of Agriculture, 1950: Places of 3 or more acres were counted as farms if the value of agricultural products raised on them in 1954, exclusive of home gardens, amounted to \$150 or more. The agricultural products could have been either for

home use or for sale. Places of less than 3 acres were counted as farms only if the value of sales of agricultural products in 1954 amounted to \$150 or more.

### FARM HOUSEHOLDS

A household that included a farm operator. (See "Farm" and "Farm operator.") Those few farm households that lived in urban places were tabulated as urban.

### FARM OPERATOR

As defined in the United States Census of Agriculture, 1950, i.e., a person who was responsible for the operation of farmland. He may have performed the labor himself or directly supervised it; he may have been either an individual operator or one of a group of individuals acting as partners. Control may have been through ownership or through lease, rental, or cropping arrangement. An operator was distinguished by the decision-making function. A hired manager was considered an operator inasmuch as he was hired to make decisions and normally to do farmwork. A farm laborer who worked for wages and did not make decisions was not considered a farm operator. A person who rented land to others, receiving a share of the product or cash for use of the land, was considered a landlord and not a farm operator.

### FOOD AWAY FROM HOME

Food and beverages (meals, snacks, and drinks) purchased and consumed by family members away from home during the week. Cost includes sales tax and tips. No value was placed on meals furnished family members as gift or pay.

### FOOD FROM ALL SOURCES

Foods purchased, home-produced, and received as gift or pay.

### FOOD HOME-PRODUCED

Includes foods raised for home use and those obtained by hunting, fishing, and collecting wild fruit and nuts. Excludes home-canned, home-frozen, and home-baked foods that were prepared from purchased ingredients.

### FOOD USED AT HOME

Food "used" means food used in an economic sense, rather than ingested, and includes food eaten, thrown away as waste, or fed to pets, but excludes food given away. (Special pet foods, not commonly eaten by people, are not included, but edible food bought for animals is included.) Food carried from home in packed meals as well as food served at home is included.

If food was prepared but not used during the survey week (7 days preceding the interview), it was not recorded. If, however, a portion of a home-prepared dish, such as a cake, was used during the period,

an estimate of the amount used of each of its ingredients was reported. In the same way, food prepared before the survey week that was used during the week was included. Foods that were canned or frozen during the survey week were not included, except for that quantity eaten during the week.

Foods were generally tabulated according to the form in which they were brought into the kitchen. Thus, homemade cake and bread were recorded as flour and other ingredients, but purchased cake and bread were entered as cake or bread. In this way, some eggs, fat, sugar, milk, and other foods consumed by households are reported under baked goods, ice cream, canned fruits, soft drinks, and the like, because that is the way they entered the kitchen. Home-canned and home-frozen fruits and vegetables that were consumed during the week were tabulated as fresh products, with sugar disregarded. Tabulations of canned and frozen fruits and vegetables in this report include only commercial products, but homemade jams, jellies, and preserves, home-canned or frozen soups, juices, pickles, and relishes are included with commercially packed items because of the lack of standardized recipes for breaking these homemade items into ingredients. These homemade mixtures were considered to be home-produced if household members had produced the chief ingredients, i.e., the fruit used for jellies, the cucumbers used in pickles.

#### HOMEMAKER

Wife of the head of the family or herself the head.

#### HOUSEHOLD

Group of persons who shared a common food supply during the week of the survey. Includes family members, housekeeping groups of unrelated persons, and guests, boarders (if fewer than five), and hired help.

#### HOUSEHOLD ELIGIBLE FOR SURVEY

One in which at least 1 person had 10 or more meals from household food supplies during the preceding 7 days.

#### HOUSEHOLD SIZE IN WEEK

The total number of meals served to all persons in the household was divided by 21 to obtain the household size in equivalent persons. The count of equivalent persons was not reduced in those households where persons omitted meals nor was it increased for between-meal snacks or additional meals, such as those served to invalids or young children.

Lunches carried from home and supplemented by purchased food were considered one-half meals; those supplemented by beverages only were counted as full meals. Refreshments served to members of the household were not counted as meals unless they served as substitutes for regular meals. Refreshments served to guests were counted according to the number of meals which they approximated.

For use in classifying households, the following intervals were used:

2-person households.....	1.46-2.45 equivalent persons
3-person households.....	2.46-3.45 equivalent persons
4-person households.....	3.46-4.45 equivalent persons
5-person households.....	4.46-5.45 equivalent persons
Households of 6 or more persons...	5.46 or more equivalent persons

#### HOUSEKEEPING HOUSEHOLD

One in which at least 1 person had 10 or more meals from household food supplies during the preceding 7 days.

Only housekeeping households of two or more persons are included in this report.

#### MILK TOTAL--CALCIUM EQUIVALENT

Approximately the quantity of fluid milk to which various dairy products (except butter) are equivalent in calcium. The chief source of data on the calcium content of the various dairy products was "Composition of Foods--Raw, Processed, Prepared," U.S. Department of Agriculture, Agriculture Handbook No. 8, June 1950.

#### MONEY INCOME, AFTER INCOME TAXES

Money income, after deduction of Federal and State income tax payments, of all persons who were members of the primary economic family during all or any part of 1954. Income included wages and salaries, net income from self-employment including farming, from real estate, and from boarders; interest, dividends, and mineral rights; pensions, annuities, allotments, contributions, relief payments, social security; unemployment insurance payments; and gross receipts from roomers. Excluded were lump-sum payments of inheritances and insurance policies. Farm income was the total of all farm receipts during the year (after payment of share rent to others) minus farm operating expenses. Farm operating expenses did not include purchases of land, depreciation or purchase of machinery, or building improvements. Net change in inventories of livestock or crops was not counted as income. Income taxes paid in 1954 were deducted from net receipts during the year.

Some households were not classified by income, either because the family was unable or unwilling to give the information regarding income or because the 1954 income was not pooled and shared by the housekeeping group.

#### MONEY VALUE OF FOOD USED AT HOME IN A WEEK

Includes cost of purchased food and alcoholic beverages (at price paid for the item at time of purchase as reported by the respondent), and money value of food produced at home or received as gift or as pay (valued at prices reported by families in the same region and urbanization group purchasing a similar item).

## NOT CLASSIFIED BY INCOME

Housekeeping households in which the income was not pooled and shared, and those that were unable or unwilling to give information about income.

## NUTRITION GROUPINGS OF FOOD

Food classified into groups having similar nutritive values. These groupings, used in tables 21 through 26, take account of the nutritional characteristics of foods rather than the form in which they appear in the retail market.

## NUTRITION UNIT

See "Equivalent nutrition unit."

## NUTRITIVE VALUE OF DIETS

Nutrients in the food reported used were calculated chiefly from table 2 of U.S. Department of Agriculture Handbook No. 8, "Composition of Foods--Raw, Processed, Prepared." This table shows quantities of nutrients obtained in the edible portions of foods purchased in generally good condition and makes allowances for inedible portions such as bone, pits, shells. For a large number of items the values in this table were revised in accordance with newer data on yields from U.S. Department of Agriculture Handbook No. 102, "Food Yields--Summarized by Different Stages of Preparation." For retail food supplies in the forms currently marketed, with a normal amount of wilt, spoilage, and other types of loss, these newer data were considered more suitable than the yield figures based on the earlier publication. Values for food not included in Handbook No. 8 were unpublished data from the files of the Department's Food Composition Unit, Consumer and Food Economics Research Division.

For this survey, estimated average losses in cooking for thiamine, riboflavin, niacin, and ascorbic acid were deducted from the composition values before these were applied to the food quantities. Loss factors used were developed for groups of foods and were based on experimental data with consideration given to usual cooking practices in the United States.

How much food was discarded either as plate waste or during or after preparation was not reported. Hence amounts of nutrients in the food actually eaten may be smaller than the amounts on which table 27 of this publication is based and this table may understate the number of households with food not furnishing specified amounts of nutrients.

Table 28, showing distributions of households by quantity of food energy in food used and by quantity of fat per 100 grams should be interpreted remembering that nutritive values included all foods used not allowing for losses of edible products due to spoilage or to wasteful practices in the household. Nutritive value of meat included all the fat on the cut as purchased.

The nutritive content was calculated only for foods. No estimate was made of the minerals in the local water or in baking powder, of calories in alcoholic beverages, or of any vitamin or mineral supplements.

## RECOMMENDED DIETARY ALLOWANCES

Levels of nutrient intake that the Food and Nutrition Board of the National Research Council recommends as normally desirable goals or objectives toward which to aim in planning practical dietaries. (Food and Nutrition Board, National Research Council Publication 302, Rev. 1953.) For this report the 1953 allowances were used as modified for application to dietary surveys by C. LeBovit and H. K. Stiebeling in "Applying 1953 Dietary Allowances to U.S. Population Groups" (Amer. Diet. Assoc. Jour. 33:219-224, 1957).

## REGIONS

The classification of States used by the 1950 Census of Population was followed. The South includes the following States: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia. The North (Northeast, North Central, and West combined) includes all States outside the South.

## RURAL FARM

See "Urbanization."

## RURAL NONFARM

See "Urbanization."

## URBAN

See "Urbanization."

## URBANIZATION

Census of Agriculture definitions of urban, rural nonfarm, and rural farm were used. Urban households lived in communities of 2,500 or more persons or in the fringe areas around cities of 50,000 or more. Farm households were those that included a farm operator, a person responsible for the operation of a farm, either performing the labor himself or directly supervising it. (See "Farm" and "Farm operator.") Those few farm households that lived in urban places were tabulated as urban. Rural households, those living outside urban places, were classified as rural nonfarm or rural farm, depending on whether a farm operator lived in the household.

All urbanizations includes urban, rural nonfarm, and rural farm households. Because the sample contains 4 times as many rural farm schedules as were required to provide proportionate representation of all groups, the total all urbanizations is a weighted total. The appropriate weights are 1, 1, and 1/4 for urban, rural nonfarm, and rural farm households, respectively. The number of households in each urbanization and region is given in table 1. When combining rural farm data with urban or rural nonfarm data it is necessary to divide by 4 the number of rural farm households shown in table 1.
